The greenback may bend but **it won't break**

*DECALIA Market Updates by Fabrizio Quirighetti,
CIO and Head of Multi-Asset*

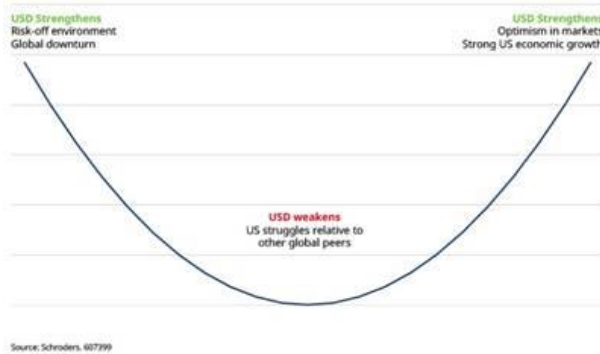

CONTENT

- After oscillating in a relatively close range for most of the year, the USD trade weighted index and the DXY (USD dollar index) have experienced a sharp decline so far this month.
- As a result, this recent USD weakness **has rekindled** both the debate about the structural downtrend of the greenback and concerns about further weakness to come in the near term. To make a long story short: we aren't so concerned and hereafter are the reasons why.

The greenback may bend but it won't break

Let's start first by trying to explain the recent USD depreciation against most major currencies. It is basically due to the [dollar smile phenomenon](#), observed about 20 years ago by Stephen Li Jen: the USD tends to outperform other currencies in **two extremely different scenarios**: when the US economy is strong (leading to higher US rates) or when the global economy is doing badly and risk appetite is low ("risk-off" environment leading to bear equity market / bull bond market).

The dollar smile

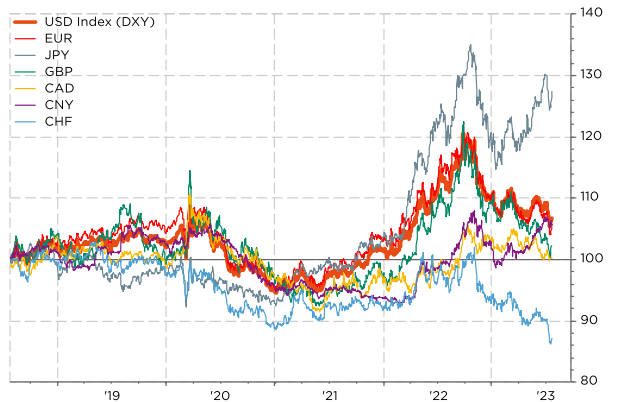

In this context, as expectations have recently mounted for a soft-landing scenario (the Fed seems to win its war on inflation without tipping the US economy into a nasty recession), that's **bad news** for the world's reserve currency according to the dollar smile theory. In other words, the US economy is neither experiencing a strong enough expansion nor a deep slump, but just moderate growth with Fed hawkishness peaking. That's the reasons why some strategists and traders, betting that inflation has now peaked, expect this downtrend is set to continue, especially considering the **structural imbalances** of the US economy (public debt and current account deficit).

While I don't rule out a shallow depreciation of US dollar in the second half of this year, I can't really imagine another collapse or a lasting leg down in the foreseeable future because everything is relative, especially when you compare the pros and the cons of a currency pair... In other words, the USD depreciation means that at least one major currency or a few other DM currencies should appreciate! Assuming you are betting against the USD, or just concerned about its fate, what are the "viable" alternatives as the 2nd best liquid enough reserve currency? You haven't so many choices between EUR, JPY, GBP, CNY, AUD, CAD or CHF. Basically, **only the EUR will qualify**. By the way, it represents indeed close to 60% of the USD index (see below the obvious subsequent close correlation between EUR and DXY).

Note for example that you won't be able to buy any JGBs if you pick the JPY, or the "geopolitical" risks associated with CNY exposure (especially for non-EM private investors / less true for EM central banks), or the small economic weights and thus lack of ample financial markets liquidity related to AUD or CHF.

USD dollar index (DXY) and selected currencies against USD over last 5y (rebased to 100)

While the CNY as well as other EM currencies are not represented in the DXY index, their weightings aren't negligible in USD trade weighted. (China accounts for 14.5%

and Mexico 13.8% according to [latest Fed's weights](#)).

On a global scale, the CNY is now the 5th most traded currency behind USD, EUR, JPY and GBP according to the latest [BIS Triennial Central Bank Survey on OTC forex](#) (see below).

The greenback may bend but it won't break

Are the EUR and/or the CNY on the cusp to take over the USD as a global reserve currency? Let me doubt so about it that I feel relax enough to bet the full house that it won't happen this year. For sure, the reserve currency status of the USD is eroding (it started with the creation of the EUR at the turn of the XXI century) but it's a long, slow, gradual and non-linear process with potential setbacks on this long journey.

When assessing the "relative benefits" of other currencies over the next few months, the macro backdrop and especially the growth prospects of the US relative to the rest of world is thus crucial to the US dollar relative performance. Right now, it seems that if the US is eventually experiencing a **soft landing**, but the euro area is much closer to a **stagnation** (at best) or a recession, while China recovery growth is already **petering out**. Therefore, economic surprises have been positive in the US lately (basically not as bad as expected), while they have turned quite negative in both Euro Zone and China. Actually, the US is outperforming all other major economies on this gauge... So, growth prospects should not be a major drag for the greenback. In relative terms.

Citi Economic Surprise Index for selected economies

Another key driver of currencies is monetary policy. Same story as the one here above: while the Fed may be close to the peak, I doubt investors will price further hawkishness from other DM central banks such as the ECB or the BoE. At the opposite, ECB hawkishness may become **less dogmatic as growth disappoints**, disinflation process extends (helped also by recent € strength / end of sustained weakness) and ECB QT eventually impacts negatively liquidity conditions in the euro area (i.e. hindering monetary policy transmission).

For the same reasons, I suspect we also have already seen **BoE peak's hawkishness pricing in rates futures markets** and I will rather bet on a downward trend on the "Quid" (i.e. GBP) now, rather than a further fall of the greenback. The Japanese Yen is the only currency that could be sustained by a (significant) divergence in monetary policy path in the next 6-12 months if the BoJ tweaks its Yield Curve Control policy this week (see below our economic calendar), leaving the door open for further tightening -even if slow and gradual- in the next few months. If BoJ doesn't move this week, they will likely stay pat until October, accumulating more evidences that Japan economy is really out of deflation risks.

In other words, other major central banks are also close to the peak hawkishness (they could be one or maximum 2 meetings away from the Fed assuming this week we see the peak in US target rates). So, there aren't many **divergences** between them as they are generally becoming less committed about the need of additional hikes.

It would be thus illusory at this stage to expect the Fed to cut because US inflation landing zone will remain above Fed's target and US growth is probably more resilient than elsewhere, while other **central banks** remain definitively hawkish (except obviously for BoJ as it is far behind). Note for example that the RBA, BoC, Norges Bank as well as BoE -to a lesser extent so far- have already started to sound less hawkish on the back of the risks associated with their respective housing market (overvalued prices, household leverage and short-term maturity mortgages refinancing).

To sum up, the **disinflation and resilient growth** mix has been a favorable support for most financial assets and an overall negative for the dollar, but the lack of broad improvement elsewhere make it difficult to foresee a sustained USD weakness going forward. For sure, the dollar has been, and is still overvalued, but you need a strong enough (relative) trigger to push it back towards its fair value. Just look at **the Swiss Franc!** And concerning the US economy structural imbalances we are all well aware, the other economies aren't in a much better seat. Just ask to the Brits! In this context, the USD still appears the least bad choice in an ugly contest.

It's definitively all relative.

The greenback may bend but it won't break

FABRIZIO QUIRIGHETTI

CIO, Head of Multi-Asset

Fabrizio Quirighetti and his team supervise \$1bn fixed income allocation for DECALIA. Before joining DECALIA, he worked for more than 17 years at Syz Asset Management. He was CIO and Head of Multi-Asset and managed various Fixed Income strategies.

Before that, he spent six years working as a teaching assistant in the Econometrics department at the University of Geneva. Fabrizio Quirighetti holds a Master's degree in applied econometrics from the University of Geneva.

From 2014 to 2020, he was an external member of the Tactical Allocation Committee of Compenswiss, the AHV/IV/EO social security fund manager.

About DECALIA SA

Established in 2014, DECALIA SA is a Swiss investment management company. With more than 70 employees and assets under management that stand at €4.9 billion, DECALIA has expanded rapidly, in particular thanks to its active-management experience built up over the last 30 years by its founders. The strategies developed by DECALIA focus on four investment themes deemed promising in the long term: the disintermediation of the banking sector, the search for yield, long-term trends and market inefficiencies. DECALIA is regulated by FINMA through a collective assets manager's license. In addition to its Geneva headquarter, the group has offices in Zurich, Milan & distributors of the DECALIA Sicav in Spain & Germany.
